activated T cell co-stimulatory receptor CD28.";
Submitted (FEB-2000) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: INTERACTS WITH SLP-76 TO REGULATE NF-AT ACTIVATION.
BINDS TO TYROSINE-PHOSPHORYLATED SHC.
-!- SIMILARITY: CONTAINS 1 SLD DOMAINS.
-!- SIMILARITY: BELONGS TO THE GRB2 / SEM-5 / DRK FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Homo sapiens (Human).

Cancer Res. 54:2615-2621(1994).

-1- FUNCTION: PROBABLE DEVELOPMENTAL PROTEIN. MAY BE A SIGNALING MOLECULE WHICH AFFECT THE DEVELOPMENT OF DISCRETE REGIONS OF TISSUES. IS LIKELY TO SIGNAL OVER ONLY FEW CELL DIAMETERS (BY SIMILARITY). OVEREXPRESSION MAY BE ASSOCIATED WITH ABNORMAL PROLIFERATION IN HUMAN BREAST TISSUE.

-1- SUBCELLULAR LOCATION: POSSIBLY SECRETED AND ASSOCIATES WITH THE EXTRACELLULAR MATRIX.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Eukaryota: Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

"Cwnt-8C: a novel Wnt gene with a potential role in primitive streak formation and hindranal organization.",
Development 119:1147-1160(1993).

-1- FUNCTION: PROBABLE DEVELOPMENTAL PROTEIN. IS LIKELY TO SIGNAL OVER ONLY FEW CELL DIAMETERS. MAY BE INVOLVED IN THE REGULATION OF AXIS FORMATION AND IN THE RHOMBOMERE SPECIFICATION.

-1- SUBCELLULAR LOCATION: POSSIBLY SECRETED AND ASSOCIATES WITH THE EXTRACELLULAR MATRIX.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Archosauria; Aves; Neognathae; Galliformes; Phasianidae; Phasianinae;

                                                SUBUNIT: RNA POLYMERASE III CONSISTS OF ABOUT 15 DIFFERENT SUBUNITS. THIS SUBUNIT IS THE LARGEST COMPONENT OF RNA POLYMERASE III (BY SIMILARITY).

SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).

MISCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).

MISCELLULAR BUKARYOTIC NUCLEI: POLYMERASE IFOR THE RIBOSOMAL RNA PRECURSOR, POLYMERASE II FOR THE MRNA PRECURSOR, AND POLYMERASE II FOR THE MRNA PRECURSOR, AND POLYMERASE II FOR SAND TRNA GENES.

SIMILARITY: BELONGS TO THE RNA POLYMERASE BETA' CHAIN FAMILY.

albumin 2S storage protein precursor Mat5-A - upland cotton
albumin 2S storage protein precursor Mat5-A - upland cotton
(.Species: Gossypium hirsutum (upland cotton)
C.Date: 16-Jul-1999 #sequence_revision 16-Jul-1999 #text_change 29-Oct-1999
C.Accession: T09878
R.Galau, G.A.; Wang, H.Y.C.; Hughes, D.W.
submitted to the EMBL Data Library, January 1992
A.Description: Cotton Mat5-A (C164) gene and Mat5-D cDNAs encoding methionine-rich 2S
A.Reference number: 216893
A.Reference number: Lanslated from GB/EMBL/DDBJ
A.Status: preliminary; translated from GB/EMBL/DDBJ
A.Residues: 1-139 <GAL>
A.Residues: 1-139 <GAL>

This protein comprises the precursor of a novel, claimed antimicrobial peptide from murine neutrophils, designated murine antimicrobial peptide from murine neutrophils, designated murine coramic adduced from a cDNA clone (see AAR78510) obtained from murine bone marrow. MGP-A and the bovine homologue, BGP-A (see AAW2724), exhibit activity against Gram-positive and Gram-regative AAW2724), exhibit activity against Gram-positive and Gram-regative Escherichia coli, Candida albicans, Salmonella typhimurium and C. candida albicans, Salmonella typhimurium and C. neoformans (claimed). They can be used in human or veterinary in properticularly to treat disorders associated with lipopolysaccharides, e.g. sepsis and endotoxaemia) or as preservatives in food products or in water supplies (claimed). They can also be applied to crops to reduce post-harvest spoilage or expressed in transgenic plants to increase their disease resistance. They have low immunogenicity. Carboxamidated analogues of MGP-A and BGP-A may also be used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antimicrobial (poly)peptide(s) from bovine and murine granulocytes useful therapeutically, as preservatives for food, in water treatment and in agriculture
                                                                                                                                                                                                                                                         Location/Qualifiers

NAME OF THE PROPERTY OF THE PR

```
This sequence is the human tag7 of the invention. Cells containing the tag7 DNA sequence are used to express recombinant tag7. Tag7 is used to produce and purify antibodies; to inhibit growth of mammalian tumnours, especially for treating carcinoma (of liver, ovary, breast, cervix, lung prostate, colon/rectum, bladder, testis, stomach, pancreas, mouth, head and neck, squamous cell carcinoma or teratocarcinoma), sarcoma (Kaposi's, osteo or fibro-sarcomas), melanoma or leukaemia; and as a molecular weight marker. The tag7 polypeptide inhibits tumour growth and induces apoptosis. The tag7 coding sequences are also useful as probes for gene mapping and detection of tag7 gene expression, and as primers. Antibodies against tag7 are used as reagents for detecting tag7; sa an antagonist of tag7; for isolating tag7 and therapeutically to inhibit or delay tumour
                                                                                                                                                                                                                                                                                                                        New nucleic acid encoding tag7 - used to inhibit tumour growth and induce apoptosis, for treatment of carcinoma, sarcoma, melanoma and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence is the murine tag? of the invention. Cells containing the tag? DNA sequence are used to express recombinant tag? Tag? Is used to produce and purify antibodies; to inhibit growth of mammalian tumours, especially for treating carcinoma (of liver. ovary, breast, cervix, lung, prostate, colon/rectum, bladder, testis, stomach, pancreas, mouth, head and neck, squamous cell carcinoma or teratocarcinoma), asrcoma (Kaposi's, osteo or fibro-sarcomas), melanoma or teratocarcinoma), asrcoma docular weight marker. The tag? polypeptide inhibits tumour growth and induces apoptosis. The tag? coding sequences are also useful as probes for gene mapping and detection of tag? gene expression, and as probes for gene against tag? are used as reagents for detecting tag?; as an antagonist of tag?; for isolating tag? and therapeutically to inhibit or delay tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention relates to 12 secreted human proteins and the nucleotide sequences encoding them. The polynucleotide sequences given in AAA80666-A80623 encode the 12 secreted protein sequences given in AAA80666-A80623 encode the 12 secreted protein sequences given in AAA80666-A80623 encode the 12 secreted proteins agiven in expensive in which they are expressed. Examples of the control they are expressed. Examples of the control they are include: immunosuppressant; activities of the proteins include: intrarteriosclerotic; antichners; vulnerary; antiarteriosclerotic; antichners; vulnerary; antiarteriosclerotic; antichners; vulnerary; antiarteriosclerotic; antichners; vulnerary; antiarteriosclerotic; antichners; vulnerary; contriviral; antiarteriosclerotic; and conditions examples of and/or diagnose various disease, disorders and conditions examples of and/or diagnose various disease, disorders and conditions examples of arthritis, dermatitis, and multiple sclerosis; inflammatory disorders such as paraporoteinaemias and purpura; cardiovascular disorders such as paraporoteinaemias and purpura; cardiovascular disorders such as paraporoteinaemias and purpura; cardiovascular disorders such as paraporoteins and polynucleotide cancer e.g. melanoma and lymphoma. The proteins and polynucleotide cancer e.g. melanoma and lymphoma. The proteins and polynucleotide cancer e.g. melanoma and lymphoma. The proteins and shallofolide sequences are represented in sequences AAA806613 and AAB25583. Sequences are represent genes related to the secreted protein genef8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptidoglycan recognition protein-like protein; PGRP; PGRP-C; regulator; chondrosarcoma; immunosuppressive; antibacterial; anti-apoptotic; tumour necrosis factor; TNF; anti-infectious; mononuclear phagocyte; inhibitor; protein co-ordinate data.
                                                                                                                                                       Isolated nucleic acid molecules encoding human secreted proteins are used for the prevention, amelioration and treatment of autoimmune, inflammatory, hyperproliferative and cardiovascular disorders, cancer, wounds, and infectious diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                Novel human peptidoglycan recognition protein-like proteins (PGRP) expressed by keratinocytes (PGRP-C), wound healing tissues (PGRP-W) or chondrosarcoma tissue (PGRP-C) are disclosed. The PGRP DRA and proteins are useful for preventing, treating or ameliorating a medical condition in a mammal (Clalmed). PGRP is useful in augmenting the immune system in such areas as immune recognition, antigen presentation and immune system activation. Antibodies or antagonists directed against
                                                                                                                                                                                                                                                                                                                                                    Polynucleotide encoding peptidoglycan recognition protein-like protein, antibodies specific to it useful for preventing, treating conditions e.g. endotoxic shock and auto-immune disorders and infections in mammal

Secreted and transmembrane proteins and nucleic acids designated PRO, useful as hybridization probes, in chromosome and gene mapping and gene
                                               AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent pCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to secreted and transmembrane proteins.
small molecule inhibitors of the relevant receptor/ligand interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fong S;
                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                 ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eaton DL, Ferrara N,

```
AAY6438 represent the EST-related proteins. AAX64651 to AAX4305. The S' ESTs can be used for producing secreted human gene products. The S' ESTs can be used for producing secreted human gene products. They can be used for producing secreted human gene regions (UTRs) and upstream regulatory regions which control the location, development stage, rate, and quantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forensic procedures to identify individuals, or in also be used in forensic procedures to identify individuals, or in gene therapy protocols. The nucleic acids encoding signal peptides can used for directing extracellular secretion of a polypeptide or the
                                                                                                                                                                                                                                                                                                                                                                      ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel secreted protein 5' expressed sequence tag sequences used in diagnostic, forensic, gene therapy, and chromosome mapping procedures
                             probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents.
   These proteins and the DNA encoding them may be used as hybridization
                                                                                                                                                                                                                                                                                                                                                                      Gaps

Its amino acid sequence was deduced from a CDNA clone (see AAT78509) obtained from bovine bone marrow. BGP-A and the murine homologue, MGP-A (see
treating a variety of human conditions. Secreted proteins have therapeutic value, and the identification of new secreted proteins is valuable. AAZ42249 to AAZ42264 and AAX64644 to AAX64650 represent sequences used in the exemplification of the present invention.

medicine (particularly to treat disorders associated with lipopolysaccharides, e.g. sepsis and endotoxaemia) or as preservatives in food products or in water supplies (claimed). They can also be applied to crops to reduce post-harvest spoilage or expressed in transgenic plants to increase their disease resistance. They have low immunogenicity. Carboxamidated analogues of BGP-A and MGP-A may also be used.

polypeptides and polynucleotides encoding them. The polypeptides having stem cell growth factor-like activity, can be expressed by standard recombinant methodology. The polynucleotides and polypeptides can be used to induce differentiation of embryonic and adult stem cells to give rise to different cell types. They may also be used in the treatment of leukemia, hemophilia, and degenerative diseases like Alzheimer's disease. They may also be used of transplants. They can also be used as nutritional supplements. The present sequence represents a tumour endothelial marker of precursor protein, homologous to a stem cell growth factor-like

The present invention relates to novel plant transcription factors from Eucalyptus grandis or Pinus radiata. The present sequence is one such transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: bZIP, bZIP family of G-box binding factors, basic New isolated polynucleotide encoding a plant transcription factor for producing a plant e.g. a woody plant, preferably eucalyptus or pine, having modified gene expression or modified activity of a polypeptide 8; Page 403; 747pp; English. The invention also claims for other human Rab protein (HRAB) CDNAs and the HRAB proteins they encode, namely HRABA (AAV32008, AAW42095). HRABB (AAV32009, AAW42095) and HRABC (AAV32010, AAW42097). The Rab proteins are claimed to be involved in the regulation of intracellular vesicular transport in both exocytic and endocytic pathways. As Rab proteins play a role in mediating the function of a viral gene, Rev, which is essential for replication of HIV-1 and as they also mediate cell cycle events, the present Rab proteins are claimed to be useful in the diagnosis, prevention, or treatment of choroideremia, AIDS and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to single exon nucleic acid probes (SENP: see A131315-A4157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                     Peptide #8322 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

encode New isolated human genes and the secreted polypeptide(s) they enco - useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders This sequence represents a secreted human protein encoded by the nucleic acid molecule designated Gene 75 from the human cDNA clone HBIAB39 (deposited as clone ATCC 97900 and ATCC 209046).

The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Pc portion (e.g. AAV59502) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 186 novel genes and their fragments (nucleic acid sequences: AAV59511-V59812; amino acid sequences AAW74731-W75026) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in

```
amino acid sequences with which they share homology. The genes and proteins have activities dependent on the tissues and cells in which they proteins have activities dependent on the tissues and cells in which they care expressed. Examples of their activities include cytostatic; are expressed. Examples of their activities include cytostatic; municosuppressive; mootropic; neuroprotective; antiviral; antiallargic; hepatotropic; antidabetts; antifungal; antiparasitic; and cardiant. The secreted proteins, polypeptides, antigonists and agonists may be useful in treating, preventing and/or diagnosing diseases and disorders such as cancer, particularly breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, unuy, or urogenital. Immune disorders such as Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; cardiovascular disorders such as
                                                                                                                                                                                       ö
the new polynucleotides. Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see AAV59511 for described uses).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polynucleotide sequences AAC95521 - AAC95570 represent cDNA encoding 50 human secreted proteins AAB52012 - AAB52161. Sequences AAB52062 - AAB52103 represent alternative polypeptides encoded by the genes, and

polynucleotide sequences AAC95521 - AAC95570 represent cDNA encoding 50 human secreted proteins AAB52012 - AAB52161. Sequences AAB52062 - AAB52103 represent alternative polypeptides encoded by the genes, and amino acid sequences with which they share homology. The genes and proteins have activities dependent on the tissues and cells in which they are expressed. Examples of their activities include cytostatic; hemourosuppressive, noctropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antilinflammatory; antivical; vulnerary; anticonvulsant; antibacterial; antifungal; antipores; vulnerary; anticonvulsant; antibacterial; antifungal; antiposis and agonists and agonists may be useful in treating, preventing and/or diagnosing diseases and disorders such as cancer, particularly breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract,
                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant; cancer; immune disease; allergy; cardiovascular disorder; wound healing; infection; neurological disease.
myocardial ischaemias; wound healing; neurological diseases such as cerebral anoxia and epilepsy; and infectious diseases such as viral, bacterial, fungal and parasitic infections may also be treated using the proteins and polynucleotides of the invention. Sequences AAC95512 - AAC95520 and AAB52011 are used in the isolation and characterisation of the proteins and polynucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Fifty nucleic acid molecules encoding human secreted proteins, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases

This invention describes a novel isolated and purified polynucleotide sequence (I) of 802 base pairs encoding the human Rab-specific guanine-nucleotide dissociation inhibitor (RGDI) polypeptide (II). The protein described in the method of the invention has anti-HIV: The antineurodegenerative, anti-isohemic, antianemic, vasotropic, recombinant production of RGDI, in gene therapy, including expression of complements of (I), as a source of antisense, triplex forming or ribozyme therapeutics, as a source of probes and primers for diagnosis and monitoring of RGDI-related diseases, in usual amplification and/or
                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RGDI; Rab-specific guanine-nucleotide dissociation inhibitor; anti-HIV; antineurodegenerative; anti-ischemic; antianemic; vasotropic; detection; hepatotropic; cytostatic; anti-inflammatory; gene therapy; apoptosis; acquired immune deficiency syndrome; neurodegeneration; aplaatic anemia; retinitis pigmentosa; ischemic injury; cirrhosis; cancer; inflammation; allergy; Crohn's disease; multiple sclerosis; diagnosis.
                                                                                                           the
allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, allabetes meallitus, Crohn's disease, multiple sclerosis. Theumatoid arthritis and ulcerative collitis; cardiovascular disorders such as myocardial ischaemias; wound healing; neurological diseases such as myocardial anoxia and epilepsy; and infectious diseases such as viral, bacterial, fungal and parasitic infections may also be treated using the proteins and polynucleotides of the invention. Sequences AAC95512.
                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New human nucleic acid encoding guanine-nucleotide dissociation inhibitor, used for diagnosis, treatment and prevention of abnormal apoptosis such as neurodegeneration or cancer
                                                                                                                                                                                                                                                                                    ö
